How to spoof mac address on android without root. Why spoof a mac address.

kubais/Shutterstock.com If you've ever tried to identify devices on a network or search for a nearby Bluetooth device, chances are you've dealt with MAC addresses. But what are they exactly, and how are they different from IP addresses? What is a MAC Address? Multiple hardware and software elements work together every day to connect us to the internet and get data to our devices. Hardware devices like routers and cables transmit the data we need, while software like border gateway protocol (BGP) and internet protocol (IP) addresses direct those data packets to and from those devices. Without both working together, we couldn't get online. One of those critical elements is the media access control (MAC) address. MAC addresses are associated with specific devices and assigned to them by the manufacturer. Other names used for MAC addresses include: Networking hardware address Burned-in address (BIA) Physical address Ethernet hardware address (EHA) Wi-Fi, Bluetooth, and Ethernet connections all use MAC addresses. MAC addresses work with the card in your device that lets it connect wirelessly to the internet, called a Network Interface Controller (NIC). MAC addresses are used to identify which device is which on your local network so that data gets sent to your computer and not your roommate's smartphone. MAC addresses are always a 12 digit hexadecimal number, with the numbers separated every two digits by a colon or hyphen. So a MAC address of 2c:54:91:88:c9:e3, for example, would be displayed 2C:54:91:88:C9:E3 or 2c-54-91-88-c9-e3. Large network adapter manufacturers like Dell and Cisco will often code their identifiers, called their Organizationally Unique Identifier (OUI), into the MAC addresses of devices they make. They're always the first six digits. Dell's, for example, is 00-14-22. RELATED: What Is a Network Adapter? How Does a MAC Address Work? When data packets from the internet hit your router, that router needs to be able to send them to the right device on its network. It does this using MAC addresses, assigning a private IP address to each network-connected device based on that device's MAC address. This is different from the IP address your internet service provider (ISP) assigns you—that's your public IP address. Your router tracks outbound data requests so that when the data comes back, it can attach the correct private IP to the data packets, then send them along to whichever device's MAC address matches that private IP. Devices can have more than one MAC address because they get one for every place they can connect to the internet. If your laptop has an ethernet port and Wi-Fi, for example, it would have different MAC addresses for the Wi-Fi connection and the Ethernet connection. Bluetooth also uses its own MAC address. RELATED: Wi-Fi vs. Ethernet: How Much Better Is a Wired Connection? How Are MAC Addresses Used? In addition to sending your data to the right place, your wireless router also uses MAC addresses to secure your connection by only accepting traffic from devices with MAC addresses that it recognizes. This is called MAC filtering. MAC addresses can also be used by technicians to troubleshoot connection problems on a network. Because they're unique to each hardware device, it's easier to pinpoint which piece of hardware connected to the network is sending and receiving data by looking at the MAC address. From there, they can see which device is having trouble connecting. How Do I Find My MAC Address? If you need to find the MAC address for your device, you can usually do it by going into the settings menu. You can follow our guide to finding the MAC addresses on your Windows device, whether by the Settings app or by the command prompt. It's also easy to find the MAC address on a Mac computer. In System Preferences, click the Network icon, select the interface you want to use, then click Advanced. You'll see the MAC address listed under the Hardware tab. Many more devices, including smart TVs, game consoles, and smartphones have their own MAC addresses that you can find. If you want to, it's also possible to change or "spoof" your MAC address. RELATED: How (and Why) to Change Your MAC Address on Windows, Linux, and Mac Technitium MAC Address Changer is a free and popular system utility tool that lets you change the MAC unique address of your Wi-Fi and LAN network adapters. Designed for Windows, the software provides various additional features that let you configure the network adapter. It also offers presets such that you can easily switch between different configurations without much effort. The software is free to download and is suitable for both beginners and advanced users. What is Technitium Mac Address Changer?All network adapters have a MAC or Media Access Control address. This address is unique and has many different purposes. When you try to connect to a network, it may check the MAC address before giving you access. In case the network deems your adapter to be unsafe, you might not be able to connect. An easy solution is to change the MAC ID of your adapter using a tool like Technitium MAC Address Changer. The free software lets you change the address of your adapter with just a click. It also has a clean interface that ensures even beginners can use it without any hassle. This program provides detailed information about each machine's Network Interface Card (NIC) that is hard-wired with a unique MAC address. It sets a new address to the NIC so users can bypass the original and work with the one randomly generated. Spoofing MAC addresses isn't difficult when you use this tool. Every machine has a NIC, and this NIC has a MAC address assigned by the manufacturer. Windows drivers use this address to connect to a Wi-Fi or LAN network. This software helps you bypass various security measures by changing this address to one that you enter manually or accept the one generated at random. Does the app have a simple interface?One of the best parts about Technitium MAC Address Changer download is that it features an organised interface with just three tabs. All of these tabs contain features that let you change the address of the MAC, have better control over your IP address, and configure various additional network settings. The software also has an information tab that shows information about the device, configuration ID, hardware data, active connections, original MAC address, updated address, and current status of TCP/IP v4/6. What are the features of Technitium MAC Address Changer?Technitium MAC Address Changer features enhanced network configuration options and presets, along with IPv6 and IPv4 support. It lets you make changes to the address of the network adapter, select a preset from a range of different presets, update the network card list, and switch between different configurations with a click. The app works well on all 32 and 64-bit Windows computers. How does Technitium Mac Address Changer work?When you open the Technitium MAC Address Changer app, the first thing it does is check your computer and identify the MAC ID of each adapter. Apart from this, the software also checks the name of the manufacturer, the maximum speed of the network, and other such information. In addition to this, it offers a manufacturer's list, so users who wish to get an address specific to a manufacturer aren't disappointed. Choosing a manufacturer lets users generate a MAC address used by the company; once you're happy with the result, just click on "Change Now" and the work will be one. You can also change the address back to what it was by clicking on the "Original" icon. Can the MAC address be changed permanently?While there's no solution to changing the MAC address permanently, Technitium MAC Address Changer lets you update the address quickly and effortlessly. The software lets you make the address persistent, delete previous adapters, configure proxies, and connect to an Ethernet Network. Is Technitium Mac Address Changer available for free?Technitium MAC Address Changer is freeware and doesn't show any advertisements. It is a feature-rich application that lets you change the address of your network adapter anytime you want. In case you want to check out some alternatives before committing, you should explore apps like Free IP Switcher, My WiFi Router, and Wireless Network Watcher. Is the Technitium Mac Address Changer any good?When connecting to a network, you may face trouble with the MAC address associated with your LAN or Wi-Fi network adapter. In case you wish to spoof the address and configure the network, you should download Technitium MAC Address Changer. The free tool has an easy-to-use interface and has several other utilities for advanced users. We don't have any change log information yet for version 6.0.7 of Technitium MAC Address Changer. Sometimes publishers take a little while to make this information available, so please check back in a few days to see if it has been updated. Can you help?If you have any changelog info you can share with us, we'd love to hear from you! Head over to our Contact page and let us know. Technitium MAC Address Changer v6.0.7 is now available for direct download and via Automatic Update. You can download the latest version release from this direct download link or via this official torrent. Technitium MAC Address Changer The software will check for update automatically as per a fixed schedule. If you want the update before the automatic update triggers, just start the software, click on Help > Check For Software Updates menu to get it done instantly. This update fixes following issues: OUI file update from IEEE.ORG fixed by updating file parser due to changes in the published file format. Fixes error handling while reading IPv4 information. Fixes some UI components that were getting distorted for some users. You can read help topics for getting answers to common queries. For any queries or issues related to this release, just post a comment below. You can also send screenshots of the software to support@technitium.com for feedback.
